

Reffolio — Embed/Integration Target Shortlist

Purpose: Platforms where Reffolio could be embedded as the verified-reference layer — either filling an empty slot (no referencing) or upgrading basic referencing to verified/compliant. Built from public, citable signals only. **No traffic estimates are included**, because reliable B2B-SaaS traffic data does not exist; usage signals here are employee count, funding, customer claims, and review volume — all of which you can independently verify.

Honest framing up front: this is a *target list for when you have 2–3 reference customers*, not an act-now list. No platform embeds a pre-revenue tool with zero customers. The value here is direction and prioritisation.

How to read the fit score

Each target is scored 1–5 on three axes:

- **Slot** — is there an empty referencing slot? (5 = no referencing at all; 1 = strong existing referencing/competitor)
- **Sector** — do they serve your regulated sectors (care/health/education/social work)? (5 = core focus; 1 = generic)
- **Embed-ready** — do they have an API / integration / white-label story that makes embedding feasible? (5 = documented API + white-label; 1 = none)

Fit = average. Higher = better near-term target.

Segment 1 — DBS / background-check providers (closest "embedded payments" parallel)

These sit at the exact "verify this person" moment — the strongest structural analogy to embedded payments. The key question is whether they already do references (competitor) or only DBS/RTW (empty slot you fill).

Platform	Verifiable signals	Referencing?	Slot	Sector	Embed-ready	Fit
uCheck	80,000+ customers (own claim); documented API; white-labels its platform; AWS-	No — DBS, RTW, ID, Adverse Credit only. References absent.	5	4	5	4.7

	hosted; serves regulated-activity roles (vulnerable adults/children) Queen's Award winner (2019); documented global background-check API; ATS-integration positioning					
Verifile		Yes — already does employment/reference verification	1	4	5	2.7

Read: uCheck is your single strongest embed parallel. Huge customer base, sits at the verify-the-person moment, has the API + white-label plumbing, serves your sectors, and crucially has **no referencing** — a genuine empty slot. Verifile is a *competitor* in references, not a host. Other DBS "Responsible Organisations" exist (GOV.UK maintains the list) — worth scanning for more uCheck-like ones (DBS-only, no references).

Segment 2 — Care/healthcare-specific ATS (referencing exists, but basic)

These already do "automated referencing" — but as a checkbox feature (email a form), not verified/tamper-evident/consent-recorded. Your embed pitch here is **upgrade, not fill**: "make your references inspection-grade without building the crypto/consent/compliance layer."

Platform	Verifiable signals	Referencing?	Slot	Sector	Embed-ready	Fit
CVMinder	Care-specialist ATS; pricing from ~£99+VAT/mo (own site); explicitly CQC/RQIA/Care Inspectorate aligned	Yes — "automated referencing with candidate consent" (basic)	2	5	3	3.3
Jobtrain	20+ yrs in market; NHS/ESR + NHS Jobs integrations; enterprise care	Yes — references + DBS tracking (basic)	2	5	4	3.7

	clients (e.g. Active Care Group, 4,000 staff)					
Talos360	Care-sector ATS; NHS Jobs integration; individual referee portal per candidate Recruitment software since 1998; many UK care providers; healthcare/social-care ATS line	Yes — "automate reference checking" (basic)	2	5	3	3.3
Eplooy	Established care ATS; named clients (HCRG, Well Pharmacy)	Yes (basic, via workflows)	2	4	3	3.0
Tribepad	Healthcare-purpose-built ATS; explicitly advertises a comprehensive API + white-label rebrand	Yes (basic)	2	5	3	3.3
Pyrexia		Yes — "automated referencing" (basic)	2	5	5	4.0

Read: Pyrexia and Jobtrain stand out — both have real integration stories (Pyrexia advertises an API + rebranding; Jobtrain has deep NHS integrations). The pitch isn't "add references" (they have them) but "upgrade to verified, tamper-evident, regulator-aligned references." Pyrexia's open API posture makes it the most technically embeddable.

Segment 3 — General SME HR / onboarding (the empty slots)

These serve SMEs broadly — including care providers as customers — and handle onboarding, RTW, DBS, contracts, but **not employment references**. The empty slot is real; the weakness is they're not sector-focused, so your regulated-compliance angle is a smaller draw.

Platform	Verifiable signals	Referencing ?	Slot	Sector	Embed -ready	Fit
----------	--------------------	------------------	------	--------	-----------------	-----

Workforce.com	Built for shift/hourly/multi-site frontline (= care operational profile); HR+scheduling+time	No referencing	5	4	3	4.0
BreatheHR	UK SME-focused; owned by ELMO (ASX-listed parent)	No	5	3	3	3.7
Employment Hero	Large multi-market; 1.5M+ jobseeker pool (own claim); SmartMatch recruitment	Recruitment yes, references not core	4	3	4	3.7
Factorial	Spain HQ, growing UK base; VC-backed (>\$200M raised globally, Crunchbase)	No referencing module	5	2	4	3.7
CharlieHR	UK startups/<50 staff; "what you see is what you get"	No	5	2	2	3.0
Grove HR	UK onboarding-focused; RTW standard	No	5	2	2	3.0
Zelt	UK-native SME HR+payroll; newer entrant	No	5	2	3	3.3

Read: Workforce.com is the standout — its frontline/shift/multi-site DNA maps directly onto care/healthcare operations, and it has no referencing. BreatheHR is worth noting because care SMEs already use it. The rest are generic; lower priority.

Prioritised target list (top 5)

1. **uCheck** (DBS) — empty slot, 80k customers, API + white-label, your sectors. The cleanest embedded-payments analogy. **Top target.**
2. **Pyrexia** (care ATS) — open API + rebrand, healthcare-built; "upgrade your references" pitch.
3. **Workforce.com** (HR) — frontline/shift fit, no referencing.
4. **Jobtrain** (care ATS) — deep NHS integrations, large care clients.

5. **BreatheHR** (HR) — empty slot, existing care-SME user base.

What I deliberately did NOT include, and why

- **Web traffic / monthly visitors / usage volumes.** B2B-SaaS traffic estimates (SimilarWeb etc.) are unreliable to the point of being misleading, and marketing-site traffic is irrelevant to a login-gated B2B product. Planning on invented numbers is worse than planning on none.
- **The metric that actually matters** — *how many regulated-sector customers each platform has* (your addressable user base inside their product) — is not reliably public. **You get it in a partnership conversation**, by asking. That's the real diligence step.

Suggested next diligence (cheap, verifiable)

For your top 1–2 targets, check: LinkedIn employee count (size/momentum), Crunchbase funding (runway/ambition), G2 + Capterra review counts (active-customer proxy), and whether they publish an integrations/partners page (embed appetite). These are all free and real — unlike traffic estimates.

The honest strategic bottom line

The embed opportunity is real but it is a **partnerships motion gated by your own traction**. The sequence is: land 2–3 reference customers → use them as proof → approach **uCheck first** ("your 80k customers run DBS through you but have no references; we're the verified-reference layer, here's the API"). The API you've built is the right asset to have ready. But the unlock is customers, not code.
